

$$f(x) = \{3x + 4, 5\}$$

$$f(x) = \{3(x + 1, 5)\}$$

$$\frac{5}{3} - 1,5 = \frac{5}{3} - \frac{3}{2} = \frac{10 - 9}{6} = \frac{1}{6}$$

$$\frac{1}{3} = \frac{2}{6}$$

$$\frac{1}{6} + \frac{2}{6} = \frac{3}{6} = \frac{1}{2}$$

$$\frac{2}{6} + \frac{2}{6} = \frac{4}{6}$$

$$\frac{2}{6} - \frac{1}{6} = \frac{1}{6}$$

$$\frac{1}{6} - \frac{2}{6} = -\frac{1}{6}$$
